

EDA Summary: No-show Appointments Dataset

Target Variable

- **Showed:** Patient attended the appointment.
 - **No-show:** Patient did not attend.
-

Gender vs No-show

- **Females:** 79.7% Showed, 20.3% No-show
 - **Males:** 80.0% Showed, 20.0% No-show
 - Males showed up slightly more than females.
-

Age vs No-show (Boxplot)

- Median age is higher among those who showed up.
 - Younger patients are more likely to miss appointments.
 - Age distribution for Showed group is wider.
-

Days Between Scheduling and Appointment

- Patients who missed appointments had longer median waiting times.
 - Patients with shorter wait times were more likely to show up.
-

Attendance by Day of the Week

- **Lowest attendance:** Saturday (76.9%)
 - **Highest attendance:** Thursday (80.7%)
 - Midweek appointments are more reliable than weekend ones.
-

Scheduled Hour vs No-show

- (To be added if analyzed)
-

SMS Reminder vs No-show

- Patients who **did not receive** an SMS had higher show-up rates (83.3%) than those who did (77.3%).
 - Reminders alone may not be sufficient to ensure attendance.
-

Scholarship vs No-show

- Without scholarship: 80.1% Showed
 - With scholarship: 76.3% Showed
 - Patients with financial aid had slightly lower attendance.
-

Medical Conditions vs No-show

Condition	With Condition (Showed)	Without Condition (Showed)
Hypertension	81.1%	79.7%
Diabetes	80.2%	79.8%
Alcoholism	82.5%	79.8%

- Patients with medical conditions were slightly more likely to attend appointments.
-

⚡ Handicap vs No-show

- Level 0 (no disability): 79.8% Showed
- Levels 1-4: 85%-100% Showed
- Disabled patients demonstrated higher commitment to appointments.
