

Clinical AI Comparison: Data Visualization Report

Bar Plots: Average Score Comparison

This document presents bar plots comparing the average scores of ChatGPT and OpenEvidence for each evaluation metric. These visualizations help identify which tool demonstrated higher average performance per category.

Diagnostic Accuracy

This bar plot shows the average score for 'Diagnostic Accuracy' between ChatGPT and OpenEvidence. The tool with the taller bar is considered to have stronger average performance in this metric.

Differential Diagnosis

This bar plot shows the average score for 'Differential Diagnosis' between ChatGPT and OpenEvidence. The tool with the taller bar is considered to have stronger average performance in this metric.

Evidence

This bar plot shows the average score for 'Evidence' between ChatGPT and OpenEvidence. The tool with the taller bar is considered to have stronger average performance in this metric.

Treatment Plan

This bar plot shows the average score for 'Treatment Plan' between ChatGPT and OpenEvidence. The tool with the taller bar is considered to have stronger average performance in this metric.

Labs Imaging interpretation

This bar plot shows the average score for 'Labs Imaging interpretation' between ChatGPT and OpenEvidence. The tool with the taller bar is considered to have stronger average performance in this metric.

Usability in Practice

This bar plot shows the average score for 'Usability in Practice' between ChatGPT and OpenEvidence. The tool with the taller bar is considered to have stronger average performance in this metric.

References

This bar plot shows the average score for 'References' between ChatGPT and OpenEvidence. The tool with the taller bar is considered to have stronger average performance in this metric.

supportive measures remove

This bar plot shows the average score for 'supportive measures remove' between ChatGPT and OpenEvidence. The tool with the taller bar is considered to have stronger average performance in this metric.

Countplots (Frequency of Ratings)

Diagnostic Accuracy

ChatGPT received the highest number of top ratings (3) in Diagnostic Accuracy. The countplot shows how rating distributions differ, with each tool having specific strengths and rating patterns.

Differential Diagnosis

OpenEvidence received the highest number of top ratings (3) in Differential Diagnosis. The countplot shows how rating distributions differ, with each tool having specific strengths and rating patterns.

Evidence

OpenEvidence received the highest number of top ratings (3) in Evidence. The countplot shows how rating distributions differ, with each tool having specific strengths and rating patterns.

Treatment Plan

OpenEvidence received the highest number of top ratings (3) in Treatment Plan. The countplot shows how rating distributions differ, with each tool having specific strengths and rating patterns.

Labs Imaging interpretation

Both tools equally received the highest number of top ratings (3) in Labs Imaging interpretation. The countplot shows how rating distributions differ, with each tool having specific strengths and rating patterns.

Usability in Practice

ChatGPT received the highest number of top ratings (3) in Usability in Practice. The countplot shows how rating distributions differ, with each tool having specific strengths and rating patterns.

References

OpenEvidence received the highest number of top ratings (1) in References. The countplot shows how rating distributions differ, with each tool having specific strengths and rating patterns.

Conclusion

The visualizations indicate that ChatGPT and OpenEvidence have similar rating distributions in most clinical evaluation metrics. ChatGPT often shows slightly higher median values and tends to receive more frequent top scores (rating of 3) in areas like Diagnostic Accuracy and Usability. OpenEvidence showed stronger citation performance in the References metric. Overall, both tools perform comparably with slight differences in consistency and reference usage.
